                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose susceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                   Homo sapiens

The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be
                                                                                                                                              Nucleic acid selected from one of 106 genes comprising single nucleotide polymorphisms, allele-specific oligonucleotides to the genes are useful for phenotypic correlations, forensics, paternity testing,
                                                                                                          Claim 1; Fig

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The protein is used as a blood coagulation inhibitor in mammals. It is believed to mimic the Xa/LACI complex in binding to and inhibiting VIIa/tissue factor. LACI inhibits via a novel feedback mechanism requiring generation of Xa (a prod. of VIIa/TF activity); XICLACIki inhibits VIIa/TF activity directly.

The DNA allows prodn. of XICLACIki by introduction of the gene into cells suitable for expression, e.g. E. coli or CHO cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    describes tissue factor binding ligands which comprise a binding region which binds to vasculature, particularly of tumours, and a tissue factor construct. The binding ligands can be used for stimulating coagulation in disease associated vasculature, particularly for the treatment of tumours. The products can also be used for treating e.g. benign prostatic hyperplasia, diabetic retinopathy, vascular restenosis, arteriovenous malformations (AWM), meningioma, hemangioma, neovascular glaucoma, psoriasis, synovitis, dermatitis, endometriosis, angiofibroma, rheumatoid arthritis, atheroscelotic plaques, corneal graft neovascularisation, haemophilic joints, hypertrophic scars, Oster-Weber syndrome, pyogenic granuloma retrolental fibroplasia, scleroderma, trachoma, or vascular adhesions. The products can also be used in binding assays.
                                                                                                                       New immunological and growth factor-based bispecific binding ligands, useful for stimulating coagulation in vasculature-associated diseases, useful for treating both benign and malignant diseases (e.g. meningioma
                                                                        Example 9; Column 129-130; 83pp; English.
                                                                                                              or hemangioma)
                                                                                                                                                                                                                                                                                                                                             05-MAR-1992;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC binding region binds to a component on the surface of a tumour. The CC second binding region is all or part of an antibody. An example of a CC coagulation factor for use in the invention is human truncated tissue CC factor. Truncated tissue factor (tTF) is the extracellular domain of the CC invention is useful for stimulating coagulation in vasculature CC associated diseases. Particularly, the binding ligand of the CC component. These diseases include benign growths (e.g. BPH), diabetic CC component. These diseases include benign growths (e.g. BPH), diabetic CC retinopathy, arteriovenous malformations, meningioma, hemongloma, CC neovascular glaucoma, psoriasis, synovitis, endometriosis, hemophylic CC ligands offer the advantage that even limited damage to the tumour CC vasculature could produce an avalanche of tumour cell death because CC each capillary provides oxygen and nutrients for thousands of tumour CC cells. The present sequence is DNA encoding coagulation factor vas used in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Best Loc

```

The invention relates to the induction of blood coagulation specifically

Example 9; Columns 131-132; 86pp; English.

Kit for inducing coagulation in tumor vasculature, useful for treating malignant or benign growths, contains ligand, linked to coagulation agent, that targets tumor marker -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Q
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CC tumour vasculature; such proteins include vascular endothelial growth CC factor (PEGF) and members of the fibroblast growth factor (PEGF) may be incorporated into the bispecific molecule in order to target coagulation to tumour vasculature. The coagulation factor-binding portion of the bispecific molecule may be, for example, directed to target coagulation CC to tumour vasculature. The coagulation factor-binding portion of the bispecific molecule may be, for example, directed to tissue factor (TF). CC Apreferred form of TF used in the invention is a truncated form (TF). CC Although tTF can associate with Factor VIIa, the tTF/Factor VIIa complex CC cannot alone initiate the coagulation cascade as the complex has to be associated with a phospholipid surface for coagulation to occur. CC However, binding of tTF to tumour vasculature via a tumour antigen/tTF bispecific antibody brings tTF into close enough proximity with the cell membrane to enable the initiation of coagulation. Kits for the induction of tumour vasculature-specific coagulation may be used to treat malignant corporate to enable the initiation of coagulation is restenosis, psoriasis, glaucoma, rheumatoid arthritis. Coagulation is induced care likely to be effective against many different types of cancer. Such kits represent PCR primers used in exemplifications of the present invention for constructs encoding tTF. TTF variants or tTF dimers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   밁

This is achieved by the use of a bispecific molecule, which comprises a region capable of binding to intratumoral vascular or stromal cells linked to a coagulation factor or to a region capable of binding to a coagulation factor. An example of such a bispecific molecule is a bispecific antibody, where one arm binds a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Vitamin-K dependent coagulation factor; tumour associated vaso carcinoma; benign prostatic hyperplasia; diabetic retinopathy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               tumour antigen, and the other arm binds a coagulation factor. The expression of certain proteins (tumour antigens) is upregulated in

```
tumour-associated vargulature which is benign or malignant. The method C can be used to treat cancer by promoting specific blood coagulation in the vasculature of the tumour relative to the vasculature in nontumour cities. Vascularised tumours are usually solid tumours, particularly CC carcinomas which require a vascular component to provide oxygen and cultients. The ligands are suitable to treat benign and malignant CC diseases with a vascular component, including benign prostatic CC hyperplasia, diabetic retinopathy, vascular restenosis, arteriovenous califormations, meningioma, haemangioma, neovascular glaucoma and CC psoriasis. The ligands can also be used in standard binding assays in CC vitro. Bispecific ligands can be designed which are capable of binding to conscular endothelial cells and disease-associated agents such as CC vascular endothelial cells and disease-associated agents are similar in CC different dieases and in different tumours, making it possible to treat cumerous diseases and indifferent types of cancer with one pharmaceutical, therefore an agent dows not need to be tailored to each individual
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This is the coding sequence for Factor X/Xa, a vitamin-K-dependent coagulation factor. This coagulation factor can be used in the formation of coaguligands. Mutated versions of this sequence can be used in the method for delivering a coagulant to a tumour-associated vasculature using bispecific binding ligands which promote blood coagulation. The binding ligand consists of identify the promote binds to a surface-expressed, surface accessible or surface-localised component of itumour cell, intratumoural vasculature or tumour associated stroma. The binding recommendation of itumour cell, intratumoural vasculature or tumour associated stroma. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Bispecific binding ligands for promoting blood coagulation in a tumour associated vasculature are useful for treating cancer - \,

This protein is used CC in the construction of a novel non-glycosylated protein and truncated CC and zymogen forms of this protein, which have serine protease activity. The protein is composed of various domains from a factor IX family CC protein, namely a catalytic domain (CD) N-terminally bound to a CZ zymogen-activating domain (ZAD), N-terminally bound to an EGF1 and/or CC grotein (EGF2 domain (ZAD), N-terminally bound to an EGF1 and/or CC (are used to identify activators/inhibitors of factor IX family proteins CC (potentially useful as regulators of coagulation, fibrinolysis and CC homeostasis). The protein in zymogen form is also useful in assays for CC detecting factor IX a activity in aqueous solution (specifically in body CC fulids). The protein can be used to produce co-crystals with protease CC variants or inhibitors for X-ray structural analysis and drug modelling CC and as restriction proteases in biotechnology. These truncated proteins CC have the same specificity as factor IX family proteases and can be CC produced in prokaryotes in a form that allows production of active enzyme CC by conversion to native form and enzymatic cleavage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches

This sequence encodes the human Factor X protein which is used in a method resulting in the production of novel human Factor X (F10) analogues. Such analogues have in the region of the natural F10a CC activation cleavage site, a modification that creates a processing site CC for a protease that does not naturally cleave F10 in this region. The CC proteins are used to generate, in vivo or in vitro, F10a analogues that CC vII or VIII, e.g.in haemophiliacs who have developed antibodies to CC factors VIII and/or IX. The encoding nucleic acid can be used in gene CC therapy of the same conditions. The analogues have high stability and can be activated without use of animal enzymes such as trypsin. Only CC The analogues can be isolated as a pure single-chain pro-protein (not usually possible because of rapid processing of the native precursor) and CC this converted to two-chain form by subsequent activation. Activated CC analogues have good stability and structural integrity and are processive information.
                                                                                                                                                                                                                    Matches
                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                       CC This sequence encodes the human Factor X protein which is used in a CC method resulting in the production of novel human Factor X (F10) CC analogues. Such analogues have in the region of the natural F10a CC activation cleavage site, a modification that creates a processing site CC for a protease that does not naturally cleave F10 in this region. The CC proteins are used to generate, in vivo or in vitro, F10a analogues that CC can be used to control bleeding and for treating defects of factors IX, CC VII or VIII, e.g. in haemophiliacs who have developed antibodies to CC factor VIII and/or IX. The encoding nucleic acid can be used in gene CC therapy of the same conditions. The analogues have high stability and can CC be activated without use of animal enzymes such as trypsin. Only CC activated without use of animal enzymes such as trypsin. Only CC converted to two-chain form by subsequent activation. Activated CC usually possible because of rapid processing of the native precursor) and CC this converted to two-chain form by subsequent activation. Activated CC analogues have good stability and structural integrity and are protected to the converted of inactive intermediates and autoproteolytic
                                                                 Matches

                                                                                                                                                                                                            The present invention describes a factor x analogue (I) which contains a modification between Glu226 and Ile235, relative to the 488 residue amino acid sequence given in AAB70411. (I) has haemostatic activity and can be used in gene therapy. (I) encoding polynucleotide (II) can be used to produce a drug, which is useful for treatment of patients with blood coagulation disorders, such as patients suffering from haemophilia, or haemophiliacs with inhibitory antibodies. Preparations containing a polypeptide with factor X/Xa activity are more readily activated by factor X1a or its derivative, which has high stability, without having to use one of the proteases used in prior art to activate the natural factor X, particularly one of animal origins, such as Russell's viper venom (RVV) or trypsin. The present sequence encodes human factor X, which is given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel factor X analog useful for producing drug which is useful for treatment of blood coagulation disorders, such as hemophilia, conta modification between amino acids Glu226 and Ile235

                                                                                                                                                                                                                                                                                                                                               oligosaccharides to the activation peptide; removal of an internal tripeptide to yield two-chain factor X and removal of the propeptide just prior to secretion. While some of these modifications do not appear essential for factor X function the removal of the signal sequence, propeptide, internal tripeptide and full gamma-carboxylation are all steps which are important requisites for the production of biologically active factor X/FXa. Isolated chimeric polynucleotides are described which encode a propeptide fused to a nucleic acid sequence encoding a vitamin K-dependent protein (VKDP). The fusion proteins encoded are vitamin K-dependent protein (VKDP).
                                                                                                                                                                               gamma-carboxylation enhancers and are useful for optimising the gamma-carboxylation of a VKDP to produce a fully gamma-carboxylated VKDP. The fusion proteins and recombinant cells expressing them are useful for alleviating a VKDP associated disease. The fusion constructs result in the production of fully gamma-carboxylated mature VKDPs which are biologically active. The i. rention encompasses all combinations of propeptide sequences (modified or not) and VKDP's. This sequence encodes the signal, propeptide and mature protein sequence of human Factor X.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Efficient processing and release of mature two-chain factor X into the circulation requires: removal of the signal sequence; formation of disulfide bonds; modification of amino terminal glutamic acid residues, to gamma-carboxyglutamic acid; modification of one aspartic acid in the first epidermal growth factor (EGF) domain to Beta-hydroxyaspartic acid; addition of N- and O-linked
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Chimeric DNA for optimizing gamma carboxylation of vitamin \kappa-dependent protein useful for treating diseases associated with the protein, comprises sequence encoding propeptide fused to sequence encoding the

                                                                                                                                                                                                                  mimetics, peptides, proteins, agonists, antagonists, antibodies or their fragments, immunoglobulins, inhibitors, drug compounds and pharmaceutical agents. Expression of [1] in a sample indicates the differentiation of embryonic stem cells into a tissue selected from brain, heart, kidney, liver, lung, skeletal muscle or pancreatic tissues. (I) and (II) are used to produce an expression profile that defines a metabolic or developmental process, treatment, condition, disease or disorder. The gene profile can be used for diagnosis, prognosis or monitoring of treatments and for investigating a predisposition to a disorder where the gene is associated with a cancer investigation.
                                                                                                                                                                                                                                                                                                                                                                                       neuroprotective activities, and can be used in gene therapy. (I) and proteins (II) encoded by then are used in high throughput screening assays to select DNA molecules, RNA molecules, peptide nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    lung; liver; uterus; ovary; stomach; intestine; kidney; pancreas; ss;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC AAH57161 to AAH57576 represent cell and tissue specific polynucleotide CC sequences (I). (I) can have cytostatic, immunomodulatory and CC neuroprotective activities, and can be used in gene therapy. (I) and CC proteins (II) encoded by then are used in high throughput screening CC assays to select DNA molecules, RNA molecules, peptide nucleic acids, CC mimetics, peptides, proteins, agonists, antigonists, antibodies or CC their fragments, immunoglobulins, inhibitors, drug compounds and CC pharmaceutical agents. Expression of (I) in a sample indicates the CC differentiation of embryonic stem cells into a tissue selected from CC brain, heart, kidney, liver, lung, skeletal muscle or pancreatic CC disease or disorder. The gene profile can be used for diagnosis, CC prognosis or monitoring of treatments and for investigating a predisposition to a disorder where the gene is associated with a carrowarhology of the compounds and concern the concern

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         variation
                                        requests: clonerequest@sanger.ac.uk Clone
on May 8, 2001 this sequence version replaced gi:13274222.
During sequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations
together with a note of the overlapping clone name. Note that the
variation annotation may not be found in the sequence submission
corresponding to the overlapping clone, as we submit sequences with
only a small overlap as described above.
This sequence was finished as follows unless otherwise noted: all
regions were either double-stranded or sequenced with an alternate
chemistry or covered by high quality data (i.e., phred quality >-
as compressions and repeats; all regions were covered by at least
one plasmid subclone or more than one M13 subclone; and the
assembly was confirmed by restriction digest. The following
abbreviations are used to associate primary accession numbers given
in the feature table with their source databases: Em:, EMBL; SW:,

Further information can be found at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             IMPORTANT: This sequence is not the entire insert of clone RP11-98F14 It may be shorter because we sequence overlapping sections only once, except for a 100 hase overlap.

The true left end of clone RP11-98F14 15 at 1 in this sequence. The true left end of clone RP11-39H12 is at 132334 in this sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             RPII-98F14 is from the library RPCI-11.1 constructed by the group of Pieter de Jong.
